

[IMAGE TRANSMISSION SYSTEM]

Abstract of Disclosure

An image transmission system includes a computer for generating image signals and an image-projecting device having a receiver and an image-projecting module. The computer includes a transmitter for wirelessly outputting the image signals. The receiver is used for receiving the image signals outputted by the computer. The image-projecting module includes an image-generating module and a lens set. The image-generating module is used for transforming the image signals received by the receiver to corresponding images. The lens set is used for projecting the corresponding images generated by the image-generating module onto a screen.
